Background

The County of Santa Cruz (County) has utilized the StreetSaver[®] pavement management program (PMP)¹ since 1989 to manage its pavement network, which is composed of approximately 585.8² centerline miles of publicly maintained roads. In 2018, NCE helped the County update their PMP. This included documenting pavement conditions for the entire network, performing budgetary analyses, and preparing a 5-year work plan.

A PMP is “*designed to provide objective information and useful data for analysis so that...managers can make more consistent, cost effective, and defensible decisions related to the preservation of a pavement network.*”³ PMPs, therefore, are designed to assist managers with the decision-making process by answering questions such as:

- What comprises the County’s road network?
- What is the existing condition of the pavement network?
- How will the condition of the pavement network change over time given the existing funding?
- How much funding is required to maintain the pavement network at the current condition level?
- Is the current condition level acceptable? If not, what is an acceptable level, and how much funding is required to achieve it?
- What maintenance and rehabilitation (M&R) strategies are available to help maintain or improve the condition of the pavement network?
- What are the maintenance priorities under different budget constraints?

Purpose

The purpose of this report is to help decision-makers optimize the use of available pavement management funds and examine the adequacy of projected revenues to meet M&R needs. This is accomplished by maximizing the return from expenditures by:

- 1) Implementing a multi-year road M&R plan,
- 2) Developing a preventive maintenance plan, and
- 3) Selecting road segments and projects with the most cost-efficient return.

This report examines the overall condition of the road network and highlights options for improving the network’s pavement condition by conducting "what if" analyses. Varying the budget amounts available for pavement M&R shows how different funding strategies would affect the County's roads over the next 10 years.

¹ StreetSaver[®] is a program developed by the Metropolitan Transportation Commission (MTC) and is the most widely used PMP in California.

² Measurement counts minor streets shorter than actual length, this is to account for intersections so that area is not double-counted for pavement resurfacing purpose. For this reason, StreetSaver reported length will differ from official maintained mileage.

³ AASHTO “Guidelines for Pavement Management Systems.” American Association of State Highway and Transportation Officials, Washington, DC, July 1990.

Project Approach

As part of the scope, condition surveys were performed on the County's entire pavement network (1,698 sections) to identify pavement distress in accordance with the MTC Pavement Distress Identification Manuals⁴. When conducting pavement condition surveys, section lengths were also measured and verified in the field, and corrections were updated in the database. In order to provide accurate surface areas for budgeting purposes, the length of the more minor of two streets at an intersection was reduced by the length of the intersection. For this reason, the lengths reported in StreetSaver are shorter than the actual maintained mileage. The inspections were completed in May 2018. The condition inspections did not address non-pavement issues such as traffic, safety and road hazards, geometric issues, road shoulders, sidewalks, curb and gutters, drainage issues, or immediate maintenance needs.

Upon completion of the data collection activities, NCE reviewed M&R strategies with County staff. This included the selection of appropriate treatments such as surface seals or overlays, and the determination of unit costs. The unit costs were based on recent bid tabs from the County as well as surrounding agencies and include all related construction, engineering, and design costs. The unit cost for various treatments are shown in Figure 6. Once appropriate M&R treatments were defined, the decision tree was updated.

NCE next performed a budget needs analysis using an analysis period of 10 years with an annual inflation rate of 3 percent. This identified M&R requirements for each road section and as well as the total M&R requirements. Finally, three budgetary scenarios were analyzed for the pavement network.

Road Network Description

As noted previously, the County is responsible for maintaining approximately 585.8 centerline miles of pavement, or 1698 pavement sections.

Table 1 and

Table 2 summarize the entire pavement network by functional class.

Table 1: Road Network Summary Statistics by Functional Class

Functional Class	Sections	Centerline Miles	Lane Miles	Total Area, sf	% by Centerline Miles
Arterials (FC 3 & 4)	112	39.0	96.2	8,254,037	7
Collectors (FC 5)	371	227.7	456.3	29,880,847	39
Locals (FC 6 & 7)	1,215	319.1	636.7	38,550,810	54
Totals	1,698	585.8	1,189.2	76,685,694	100%

⁴ Pavement Condition Index Distress Identification Manuals (Asphalt Concrete 4th Edition, Portland Cement Concrete 3rd Edition). Metropolitan Transportation Commission, San Francisco, CA, March 2016.

Table 2: Road Network Summary Statistics by Supervisor District

Supervisor District	Sections	Centerline Miles	Lane Miles	Total Area, Sf	% by Centerline Miles
District 1	561	164.1	338.5	22,606,023	28
District 2	490	175.2	353.4	24,797,655	30
District 3	126	58.8	117.3	7,031,670	10
District 4	109	45.9	92.9	5,890,193	8
District 5	412	141.8	287.1	16,360,153	24
Totals	1,698	585.8	1,189.2	76,685,694	100%

The network replacement cost is estimated to be approximately \$938 million including drainage. This can be viewed as the value of the pavement network and is the amount needed to fund a full reconstruction of the road network. It does not include related infrastructure assets such as sidewalks, signals, markings, signs, etc.

Pavement Current Condition

The pavement condition index, or PCI, is a measurement of the pavement condition and ranges from zero to 100. A newly constructed road will have a PCI of 100, while a failed road will have a PCI of 25 or less.

Figure 1 illustrates the definitions of the five pavement condition categories.

I	Good/Very Good	100
II/III	Fair (non-load) Fair (load-related)	65
IV	Poor	45
V	Very Poor/Failed	25
		0
Condition Category	Pavement Condition	PCI

Figure 1: Pavement Condition Categories by PCI

A list of all sections in the network along with their attributes, including PCI at the time of last inspection, is provided in Appendix D. For convenience, there are two listings – one sorted alphabetically by road name and the other sorted by descending PCI.

A pavement's condition is affected by the environment, traffic loads and volumes, construction materials, and age. The deterioration of the pavement is classified in terms of distresses. The distresses describing the deterioration of asphalt concrete (AC) pavements are:

1. Alligator or Fatigue Cracking
2. Block Cracking
3. Distortions
4. Longitudinal/Transverse Cracking
5. Patching and Utility Cuts
6. Rutting and Depressions
7. Raveling
8. Weathering

The distresses describing the deterioration of Portland cement concrete (PCC) pavements are:

1. Corner Break
2. Divided Slab
3. Faulting
4. Linear Cracking
5. Patching and Utility Cuts
6. Scaling, Map Cracking, and Cracking
7. Spalling

Roads in "Good" condition include roads with both non-load-related (weathering or raveling) and load-related (e.g., alligator cracking) distresses. Since these distresses are markedly different, the treatments used to address these conditions are also different, as are the costs of these treatments. Generally, roads with load-related distress are more expensive to repair. The two categories of distress are identified by II (non-load-related) and III (load-related). StreetSaver will assign the appropriate treatments and costs to roads identified within each category. Note that the "Maintenance and Rehabilitation Decision Tree" in Appendix A assigns different condition category labels than those in Figure 1 but the PCI ranges are equivalent.

Figure 2 on next page shows examples of roads with different PCIs.

Figure 2: Examples of Roads with Different PCIs

The current average PCI for the County's road network is 48. This value is an area-weighted calculation performed in StreetSaver. For a given pavement section, the remaining service life (RSL) is the time it takes to deteriorate to "Very Poor/Failed" condition if no maintenance occurs. The average RSL for the pavement sections in the network is estimated to be approximately 10 years.

Table 3 as well as Figures 3 and 4 breaks down the network pavement condition by condition category and functional classification. Currently, the County's Arterials and Collectors are in "Fair" condition with Locals in the "Poor" condition category. Approximately half of the County's roads fall in the "Good/Very Good" or "Fair" condition category and the other half in the "Poor" or "Very Poor/Failed" condition category. Overall, Arterials are in better condition than the Collectors and Locals (Figure 4).

Figure 3: Pavement Network Breakdown by Condition Category

Figure 4: Pavement Network Breakdown by Functional Classification

Table 3: 2018 Pavement Network by Condition Category and Functional Class

Condition Category	PCI Range	Arterials (%)	Collectors (%)	Locals (%)	Entire Network Area(%)
Good (I)/Very Good	65-100	5.6	15.5	9.9	31.0
Fair (II/III)	45-64	3.6	10.6	8.3	22.5
Poor (IV)	25-44	1.0	7.1	13.8	21.9
Very Poor/Failed (V)	<25	0.5	5.8	18.3	24.6
Total		10.7	39.0	50.3	100

Figure 5 shows the County's network PCI compared to neighboring agencies. The presented data were also collected by NCE on behalf of the listed agencies. Additionally, the statewide average PCI from the 2018 California Statewide Local Streets and Roads Needs Assessment⁵ is included for comparison. As illustrated, the County's network PCI is 17 points below the statewide average and in the bottom third when compared to its neighbors.

Figure 5: 2018 Pavement Condition Index Compared to Neighboring Agencies

⁵ "California Statewide Local Streets and Roads Needs Assessment 2018 Update." Nichols Consulting Engineers Chtd, CA, October 2018.

Maintenance and Rehabilitation Strategies

Historically, the County has used a combination of slurry seals, rubberized chip seals, single chip seals, micro-surfacing and Hot Mix Asphalt (HMA) overlays as M&R treatments. NCE recommends using surface seals as a preventive maintenance strategy when the pavements are in “Good/Very Good” and “Fair” (non-load) condition, then applying HMA overlays as the pavement condition deteriorates to “Fair” (load-related) or “Poor” condition. Digouts are recommended to prepare the pavement structure prior to an overlay or seal as necessary. Finally, as the pavement deteriorates to “Very Poor/Failed” condition, NCE recommends surface reconstruction. These recommended treatments are formalized in the M&R decision tree presented in Appendix A.

Figure 6 illustrates the relevance of the colloquial saying: “pay me now, or pay me more later”, to pavement management. History has shown that it costs much less to maintain roads in good condition than to repair roads that have failed. By allowing pavements to deteriorate, roads that once cost \$10 per square yard (SY) to seal may soon cost \$40/SY to overlay or \$75/SY to reconstruct. In other words, delays in repairs can significantly increase maintenance costs.

Figure 6: Costs of Maintaining Pavements over Time

Budget Needs

Once the pavement condition has been determined, and the appropriate maintenance treatments developed, then it is possible to determine the funding needs for the County's roads. Simplistically, the StreetSaver program seeks to answer the following questions:

If funding is not a constraint, how much money is needed to bring the pavement condition to a state of good repair?

Based on the principle that it costs less to maintain roads in good condition than it does to reconstruct those in bad condition, effective PMPs develop a maintenance strategy that brings the overall condition of the network to an optimal PCI and then maintains it. By not addressing maintenance needs, the condition of the network will inevitably decline. In order to correct such deficiencies, a cost-effective M&R strategy must be implemented.

The first step is to determine the maintenance needs of the pavement network; in other words, the cost associated with performing all M&R treatments at the optimal time. The County's current maintenance needs figure was calculated by performing a budget needs analysis in StreetSaver with an inflation rate of 3 percent.

The total maintenance needs for the County's network over the next 10 years is estimated at \$489.7 million (average \$49 million per year). Of this total, approximately \$88.9 million (18.2 percent) is devoted to preventive maintenance, while \$400.8 million (81.8 percent) is allocated for more costly rehabilitation and reconstruction treatments. Table 4 shows the projected needs for each year with the corresponding PCI.

Table 4: Summary Results for Needs Analysis

Year	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	Total
PCI Treated	81	75	73	71	69	72	70	79	73	71	--
PCI Untreated	48	45	42	39	36	34	31	29	27	25	--
Needs (\$Millions)	266	11.5	7.3	0.7	1.4	89	9.3	99.2	3.2	2.1	489.7

If the County follows this ideal strategy, the average network PCI would immediately and significantly increase, as a large amount of deferred maintenance is addressed in the first year. The PCI would then stabilize at a maintainable level in the 70s. This type of budget, which addresses all the deferred maintenance (unfunded backlog) in the first year, is known as front-loaded. If no maintenance is performed during the next 10 years, the network PCI will drop to 25 by 2028.

Note that the prediction models in StreetSaver do not account for the impacts of newer and more cost-effective technologies. For example, if asphalt-binders with rubber or polymers are used, the actual performance of these treatments may not be adequately modeled. This results in a higher funding need. Consequently, NCE recommends regular pavement condition surveys, decision tree updates, and budget analyses to ensure model accuracy and relevance.

Budget Scenarios

The next step in developing a cost-effective M&R strategy is to conduct several “what-if” analyses using StreetSaver’s budget scenario module. This module seeks to answer the following questions:

If funding is constrained, what is the most cost-effective way to spend the funds? What are the consequences on the PCI and deferred maintenance? Which roads will be prioritized for repairs and when will they be repaired?

The program projects the effects of the different scenarios on PCI, deferred maintenance (unfunded backlog), and average RSL of the network. By examining the effects on these indicators, the advantages and disadvantages of different funding levels and maintenance strategies become clear. The budget scenarios presented below were examined for the County to provide support for decision making:

Reference: Funding needed to bring network to “Good” condition (\$49 million/year)
(see Pavement needs shown in Table 4)

Scenario 1: County’s Existing Funding (\$8 million/year) – Based on the County’s existing funding level of \$8 million per year for the next 10 years, this scenario predicts the consequences on the network. The deferred maintenance will increase from \$266 million to \$479 million and the overall PCI will decrease to 33 by 2028.

Scenario 2: Maintain PCI at 48 (Average \$24.4 million/year)– This scenario aims to ensure that the overall pavement network PCI does not drop below 48 over next 10 years. An annual average budget of \$24.4 million is required for the next 10 years to maintain the PCI. The deferred maintenance will increase from \$266 million to \$330 million by 2028.

Scenario 3: Maintain Arterial and Collector PCI at 56; Do nothing for Local Route (\$15 million/year) – This scenario seeks to maintain only arterial and collector network PCI at 56. An average budget of \$15 million per year is required for next 10 years. The deferred maintenance will still increase to \$410 million by 2028.

Note: The term “deferred maintenance” consists of pavement maintenance that is needed but cannot be performed due to lack of funding. Shrinking budgets have forced many cities and counties to defer much-needed pavement maintenance. By deferring maintenance, the frequency of citizens' complaints about the condition of the network may increase, and the cost to repair these roads rises as well.

The following sections provide a summary of the budget scenarios. More detailed results of the budget needs and budget scenarios are included in Appendix B.

Appendix C contains maps that illustrate the current condition and results of each scenario. The maps show the pavement network, highlighting the condition category of each pavement section in 2028 for each scenario.

Scenario 1: County's Existing Funding (\$8 million/year)

This scenario assesses the impacts of the County's existing funding of \$8 million per year for the next 10 years. The results indicate that the network PCI will decrease to 33 by 2028. More specifically, the average PCI of the Arterials and Collectors will decrease to 40 and the Locals PCI will drop to 26. Approximately one-third of the pavement will be in "Good/Very Good" or "Fair" condition. The deferred maintenance will increase to \$479 million, and the projected RSL will be 7 years (Table 5 and Figure 7).

Table 5: Summary Results for Scenario 1

Year	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	Total
Budget (\$M)	4.6	5.3	6.5	7.8	8.0	9.3	9.6	9.8	9.8	9.8	80.5
Deferred Maintenance (\$M)	267	304	334	355	378	401	425	441	459	479	--
PCI	48	46	43	41	40	38	37	35	34	33	--
RSL (Years)	10	9	9	8	8	8	8	7	7	7	--

Figure 7: PCI and Deferred Maintenance for Scenario 1

Scenario 2: Maintain PCI at 48 (\$24.4 million/year)

This scenario seeks to maintain the network PCI at 48 over the next 10 years. A total of \$243.6 million is required and the amount allocated to preventive maintenance is approximately 8%. More than half of the pavement network will be in “Good/Very Good” or “Fair” condition, with a quarter in the “Very Poor/Failed” condition category. The deferred maintenance will increase to \$330 million due to inflation and lack of funding, and the projected RSL will be 12 years by 2028 (see Table 6 and Figure 8).

Table 6: Summary Results for Scenario 2

Year	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	Total
Budget (\$M)	8.4	24.9	35	37.1	17.7	22	21	25	24	28.5	243.6
Deferred Maintenance (\$M)	266	286	290	284	298	304	319	324	333	330	--
PCI	48	48	48	48	48	48	48	48	48	48	--
RSL (Years)	10	10	11	11	11	11	11	12	12	12	--

Figure 8: PCI and Deferred Maintenance for Scenario 2

Scenario 3: Maintain Arterials and Collectors PCI at 56; Do nothing for Local Route (\$15 million/year)

This scenario aims to maintain the PCI of the Arterials and Collectors at 56 for the next 10 years; a total of \$150.4 million is required. At the same time, the Locals PCI will drop to 24, resulting in an average PCI of 40. More than half of the pavement network will be in “Poor” or “Very Poor/ Failed” condition, with one-third in the “Good/Very Good” condition category. The deferred maintenance will increase to \$411 million and RSL will be 9 years (Table 7 and Figure 9).

Table 7: Summary Results for Scenario 3

Year	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	Total
Budget (\$M)	4.8	10.1	18.7	20.3	20.2	15.9	15.7	12.9	15.9	15.9	150.4
Deferred Maintenance (\$M)	266	299	316	324	333	346	366	381	396	411	--
PCI	48	47	45	44	45	43	42	41	41	40	--
RSL (Years)	10	10	10	9	10	10	10	9	9	9	

Figure 9: PCI and Deferred Maintenance for Scenario 3

Scenario Comparisons

The following two figures graphically illustrate the annual changes in PCI and deferred maintenance for each scenario. Figure 10 illustrates the changes in PCI over time for all three scenarios; clearly, the County's existing funding is not enough to improve the current PCI. Triple the funding will be needed just to maintain a PCI of 48.

Figure 10: Annual Pavement Condition Index by Scenario

Figure 11 illustrates the change in deferred maintenance over time for each budget scenario analysis. All scenarios will increase the deferred maintenance by 2028. Scenario 2 will have the lowest increase at \$64 million.

Figure 11: Annual Deferred Maintenance by Scenario

Figure 12 illustrates the pavement condition changes under various scenarios. Currently, about one-third of the network is in “Good/Very Good” condition, 22.5 percent is “Fair”, 21.9 percent is “Poor,” and about one-quarter of the network is in “Very Poor/Failed” condition.

Scenario 1 will reduce the network percentage in “Good” condition while other two scenarios (Scenarios 2 and 3) will see improvements, with Scenario 2 having the biggest positive impact. The County’s current funding will also result in almost half of the pavement network in “Very Poor/Failed” condition.

Maps illustrating the current condition of the pavement network compared to the results of each scenario at the end of the 10-year analysis period are provided in Appendix C.

Figure 12: Comparison of Current Pavement Conditions and Changes under Scenarios 1 to 3

Discussion

To summarize, the County of Santa Cruz has a substantial investment of \$938 million in the pavement network. Overall, the County's pavement network is in "Fair" condition with a 2018 average PCI of 48. Of the 585.8 County-maintained centerline miles, more than one-quarter of the pavement network is currently in "Good/Very Good" condition with a quarter in "Very Poor/Failed" condition.

The analyses indicate that the County needs to spend approximately \$489.7 million in pavement maintenance over the next 10 years to essentially repair all roads. By doing so, roads then can be maintained in good condition with on-going preventive maintenance.

The most desirable scenario is to reduce the deferred maintenance to zero, but this is not possible for many reasons and is unrealistic for most agencies. However, the goal should be to offer residents a safe space and functional pavement network without unduly increasing the maintenance burden in the future.

To demonstrate the relative costs of different treatment strategies, Figure 13 illustrates the number of lane miles that may be resurfaced in each scenario. The number of lane miles listed assumes that the entire annual budget is spent on only one treatment. This illustrates that a surface seal can be placed on approximately four times as many miles as roads requiring overlays, and one road slated for reconstruction is equivalent to sealing about seven roads.

Figure 13: Paving Capabilities by Lane Miles

Recommendations

A. Pavement Budget

NCE recommends that the County follow Scenario 2, which requires a total of \$243.6 million over the next 10 years. This will allow County to maintain their network at 48 where 43% of the pavement networks would be in “Good/Very Good” Condition by 2028. Scenario 2 will help maintain the deferred maintenance below \$350 million, whereas the other two scenarios will result in more than \$400 million deferred maintenance by the end of 10 years.

B. Pavement Maintenance Strategies

The County’s pavement maintenance strategies should include a balance of surface seals, overlays, and reconstruction. Since half of the pavement network is in “Good/Very Good” or “Fair” condition, it is important to preserve the condition as much as possible. Crack sealing is relatively inexpensive and can keep moisture out of the pavement structure, thus preventing the underlying aggregate base from premature failure. Life-extending surface treatments such as slurry seals or microsurfacing are also cost-effective for pavements currently in fair to good condition.

NCE recommends that the County pursue a well-funded preventive maintenance program, with rehabilitation projects to improve pavements currently in poor condition. This is necessary to at least maintain the portion of the pavement network in “Good” condition and avoid increasing the deferred maintenance.

C. Re-inspection Strategies

In order to continue monitoring the pavement network, and make appropriate decisions, NCE recommends that arterial and collector roads be inspected every 2 years and residential roads every 4 to 5 years.

D. Maintenance and Rehabilitation Decision Tree

The M&R treatment strategies and associated unit costs should be reviewed and updated annually to reflect new construction techniques/costs. This will ensure budget analysis results are reliable and accurate.

A significant unknown variable is the future cost of rehabilitation. With the recent instability of oil prices, NCE recommends careful monitoring of construction costs and a readiness to adapt to price increases if necessary.

E. Next Steps

NCE recommends that the County undertake the following steps:

- Maintain a preventive maintenance strategy.
- Pursue additional pavement funding sources to ensure that Scenario 2 is feasible. Examples of potential funding sources are listed below.

Federal Funding Sources

- Regional Surface Transportation Program (RSTP)
- Surface Transportation Program (STP)
- Congestion Mitigation and Air Quality Improvement Program (CMAQ)
- Community Development Block Grant (CDBG)
- Highway Safety Improvement Program (HSIP)
- Federal Emergency Management Agency (FEMA)
- Transportation Enhancement Activities (TEA)

State Funding Sources

- Active Transportation Program (ATP) which now includes the Bicycle Transportation Account (BTA) and Safe Routes to Schools (SR2S)
- State Transportation Improvement Program (STIP)
- AB 2766 (vehicle surcharge)
- Vehicle License Fees (VLF)
- CalRecycle grants
- State Water Resource Control Board
- Transportation Development Act (TDA)
- Traffic Safety Fund
- Transportation Uniform Mitigation Fee (TUMF)

Local/Regional Funding Sources

- Development impact fees
- General funds
- Various assessment districts – lighting, maintenance, flood control, special assessments, community facility districts
- Traffic impact fees
- Utilities; e.g., stormwater, water, wastewater enterprise funds
- Parcel/property taxes
- Vehicle registration fees
- Vehicle code fines
- Transient Occupancy Taxes

APPENDIX A

Maintenance and Rehabilitation Decision Tree

Maintenance and Rehabilitation (M&R) Decision Tree

This report presents the current maintenance and rehabilitation decision tree that exists in the database. The decision tree forms the basis for all of the budgetary computations that are included in this volume. ***Changes to the decision tree will make the results in the budget reports invalid.*** All pavement treatment unit costs relevant to the road types in the database were updated.

The decision tree lists the treatments and costs selected for preventive maintenance and rehabilitation activities. Each line represents a specific combination of functional classification and surface type.

The preventive maintenance portion of the report is identified as Condition Category I – Very Good. All preventive maintenance treatment listings are assigned only to sections in Condition Category I where the $PCI \geq 70$. Sections with PCI values less than 70 are assigned to treatments listed in Categories II through V.

In the preventive maintenance category ($PCI \geq 70$), a time sequence is used to identify the appropriate treatment and cost. Each preventive maintenance treatment description consists of three parts: 1) a CRACK treatment, 2) a SURFACE treatment, and 3) a RESTORATION treatment. These three parts allow the user to specify one of three different preventive maintenance treatments depending on the prior maintenance history of the section.

1. The CRACK treatment part can be used to specify the most frequent type of preventive maintenance activity planned (typically crack seals).
2. The SURFACE treatment part can be used to specify more extensive and less frequent preventive maintenance activities, such as slurry seals. For example, a crack seal can be specified on a 3-year cycle with a slurry seal specified after 5 years.
3. The RESTORATION part can be used to specify a surface restoration treatment (such as an overlay) to be performed after a specified number of surface treatments. For example, after a certain number of successive slurry seals, an overlay can be specified instead of another slurry seal.

Rehabilitation treatments are assigned to sections in Condition Categories II through V (PCI less than 70). Each line is defined by a specific combination of functional classification, surface type, and condition category.

COLUMN	DESCRIPTION
Functional Class	Functional Classification identifying the branch number.
Surface	Surface Type identifying the branch number.
Condition Category	Condition Category (I through V).
Treatment Type	First Row (Crack Treatment) indicates localized treatment (e.g. crack sealing). Second Row (Surface Treatment) indicates surface treatment (e.g. slurry sealing). Third Row (Restoration Treatment) indicates surface restoration (e.g. overlay).
Treatment	Name of treatments from the "Treatment Descriptions" report.

COLUMN	DESCRIPTION
Yrs. Between Crack Seals	First Row - number of years between successive treatment applications specified in the first row (i.e. CRACK treatment).
Yrs. Between Surface Seals	Second Row - number of years between successive treatment applications specified in the second row (i.e. SURFACE treatment).
Number of Sequential Seals	Number of times that the treatment application in the second row (i.e. SURFACE treatment) will be performed prior to performing the treatment application in the third row.

Note that the treatments assigned to each section should not be blindly followed in preparing a road maintenance program. Engineering judgment and project level analysis should be applied to ensure that the treatment is appropriate and cost effective for the section.

APPENDIX B

Budget Needs

Projected PCI / Cost Summary

Preventative Treatment / Cost Summary

Rehabilitation Treatment / Cost Summary

Budget Needs Reports

The purpose of this module is to answer the question: ***If the County had all the money in the world, what sections should be fixed and how much will it cost?*** Based on the Maintenance & Rehabilitation (M&R) decision tree and the PCIs of the sections, the program will then select a maintenance or rehabilitation action and compute the total costs over a period of ten years. The Budget Needs represents the "ideal world" funding levels, while the Budget Scenarios reports in the next section represent the most "cost effective" prioritization possible for the actual funding levels.

A budget needs analysis has been performed. The summary results from the analysis are shown below. An interest rate of 3% and an inflation factor of 3% were used to project the costs for the next ten years. This report shows the total ten-year budget that would be required to meet the County's standards as exemplified in the M&R decision tree.

As indicated in the report, with a budget of \$489.7 million dollars over the next ten years the PCI of the road network will improve from the current level of 48 to 71 by 2028. If no treatments are programmed, the weighted average PCI is projected to deteriorate to 25 by 2028.

Budget Needs reports included in this volume are listed below:

- Projected PCI/Cost Summary
- Preventative Maintenance Treatment/Cost Summary
- Rehabilitation Treatment/Cost Summary

Needs - Projected PCI/Cost Summary

This report summarizes and projects the County's network PCI values over a ten-year period, both with and without treatments applied. These costs are based on those in the M&R decision tree. It also projects the costs over a ten-year period.

COLUMN	DESCRIPTION
Year	Year in the analysis period.
PCI Treated	Projected network average PCI with all needed treatments applied.
PCI Untreated	Projected network average PCI without any treatments applied.
PM Cost	Total preventive maintenance treatment cost.
Rehab Cost	Total rehabilitation treatment cost.
Cost	The budget required for each year in the analysis period to meet the County's standard as shown on the M&R decision tree.
Total Cost	Total budget required over a ten-year period.

Needs - Projected PCI/Cost Summary

APPENDIX D

Section Description Inventory

Section Description Inventory Report

This report lists a variety of section description information for each of the County's pavement sections. It lists the road and section identifiers, limits, functional class, surface type, number of lanes, lengths, widths, PCI, and area identifier.

All of the County's pavement sections are included in the report. The report is sorted alphabetically by Road Name and Section ID. The field descriptions in this report are listed below:

COLUMN	DESCRIPTION
Road ID	Road Identification - A code up to ten characters/digits to identify the road. Generally, the road name is truncated to six characters. The Road ID should be unique for each road.
Section ID	Section Identification - A code up to ten characters/digits to identify the section number. The Section ID must be unique for each section of one road.
Road Name	Road Name - The name of the road as indicated by road signs in the field.
Beg Location	Beginning limit of the section.
End Location	Ending limit of the section.
# of Lanes	Number of travel lanes.
Functional Class (FC)	Functional Classification: OPA (Other Principal Arterial), MiA (Minor Arterial), MaC (Major Collector), L (Local/Residential/Minor Collectors)
Length (ft)	Length of the section in feet.
Width (ft)	Average width of the section in feet.
Area (ft ²)	Area of section in square feet.
Surface Type (ST)	Surface Type: A (AC), C (AC/PCC), O (AC/AC), P (PCC), G (Gravel), S (Surface Treatment)
PCI Date	The last inspection date or rehabilitation date.
PCI	Average PCI for the section. The value is the calculated PCI based on the most recent field inspections or maintenance data (i.e. 2018 inspections).
